

# Measurement of excited state $\Upsilon$ in PbPb collision with CMS

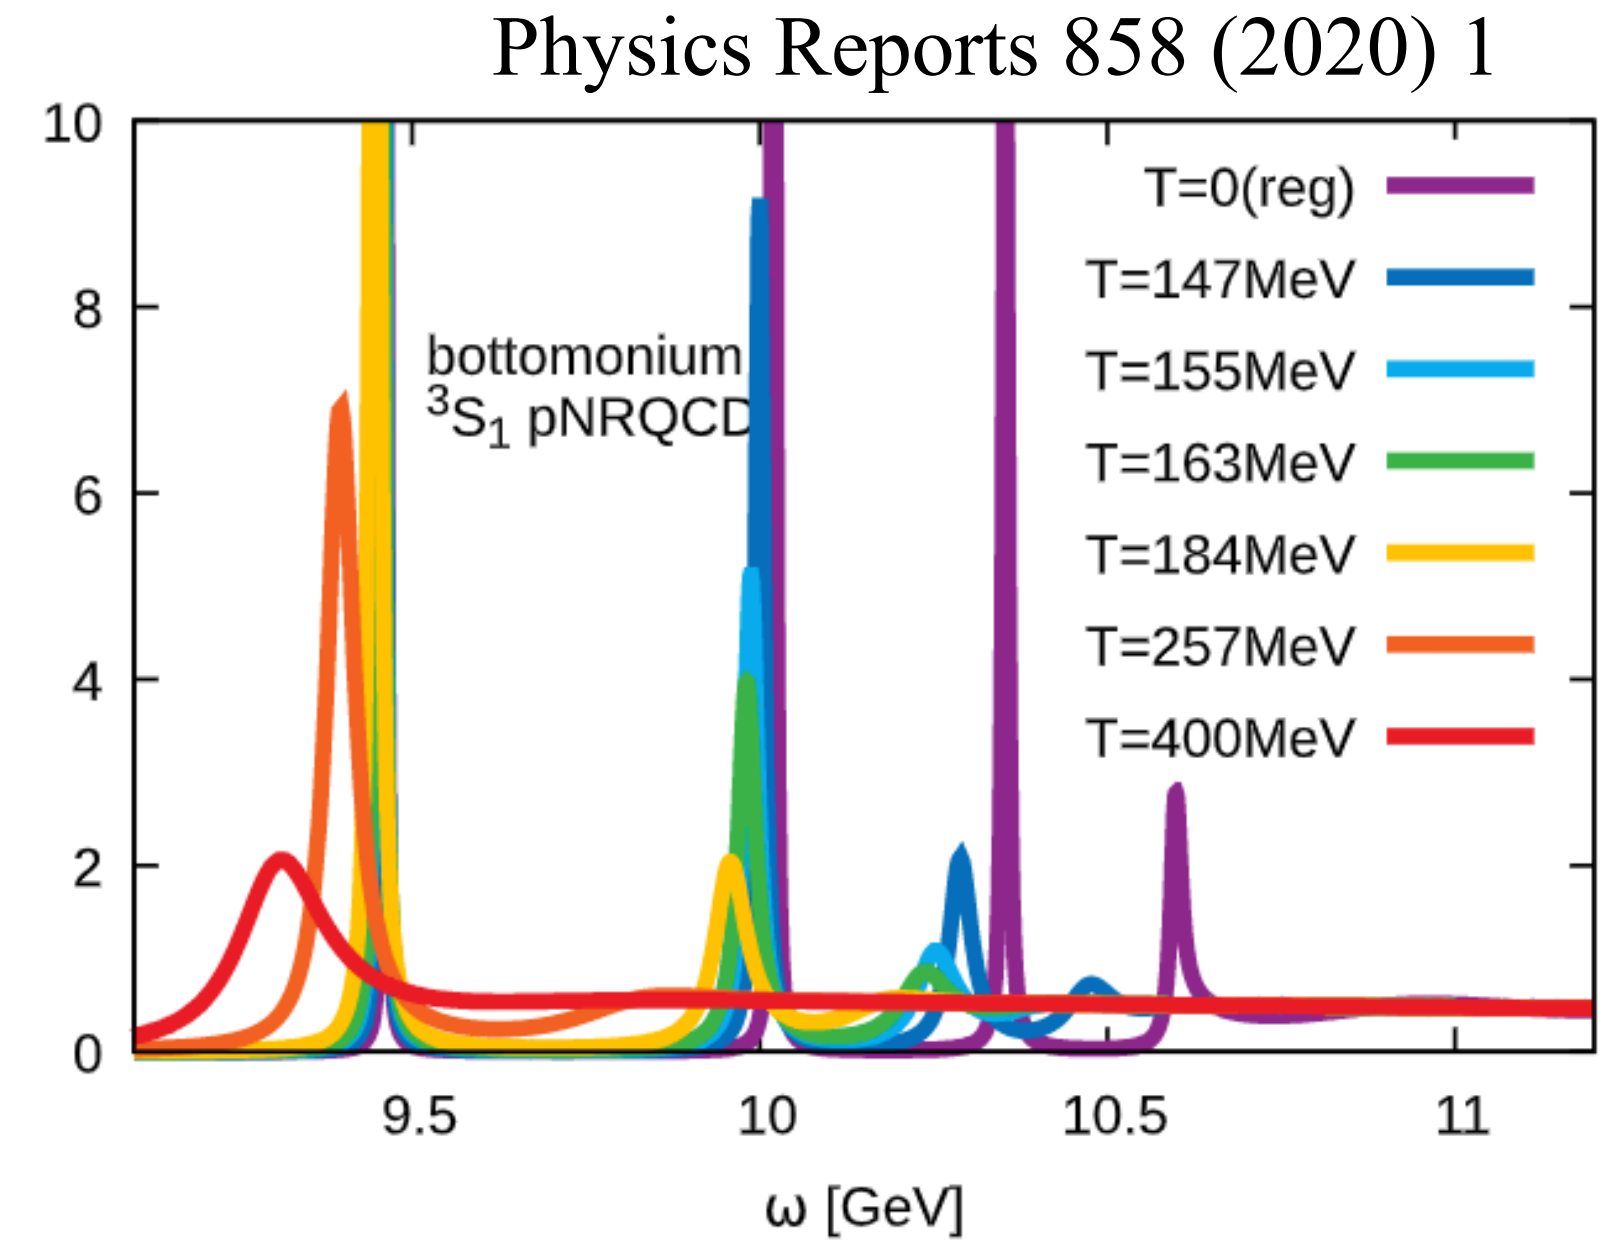

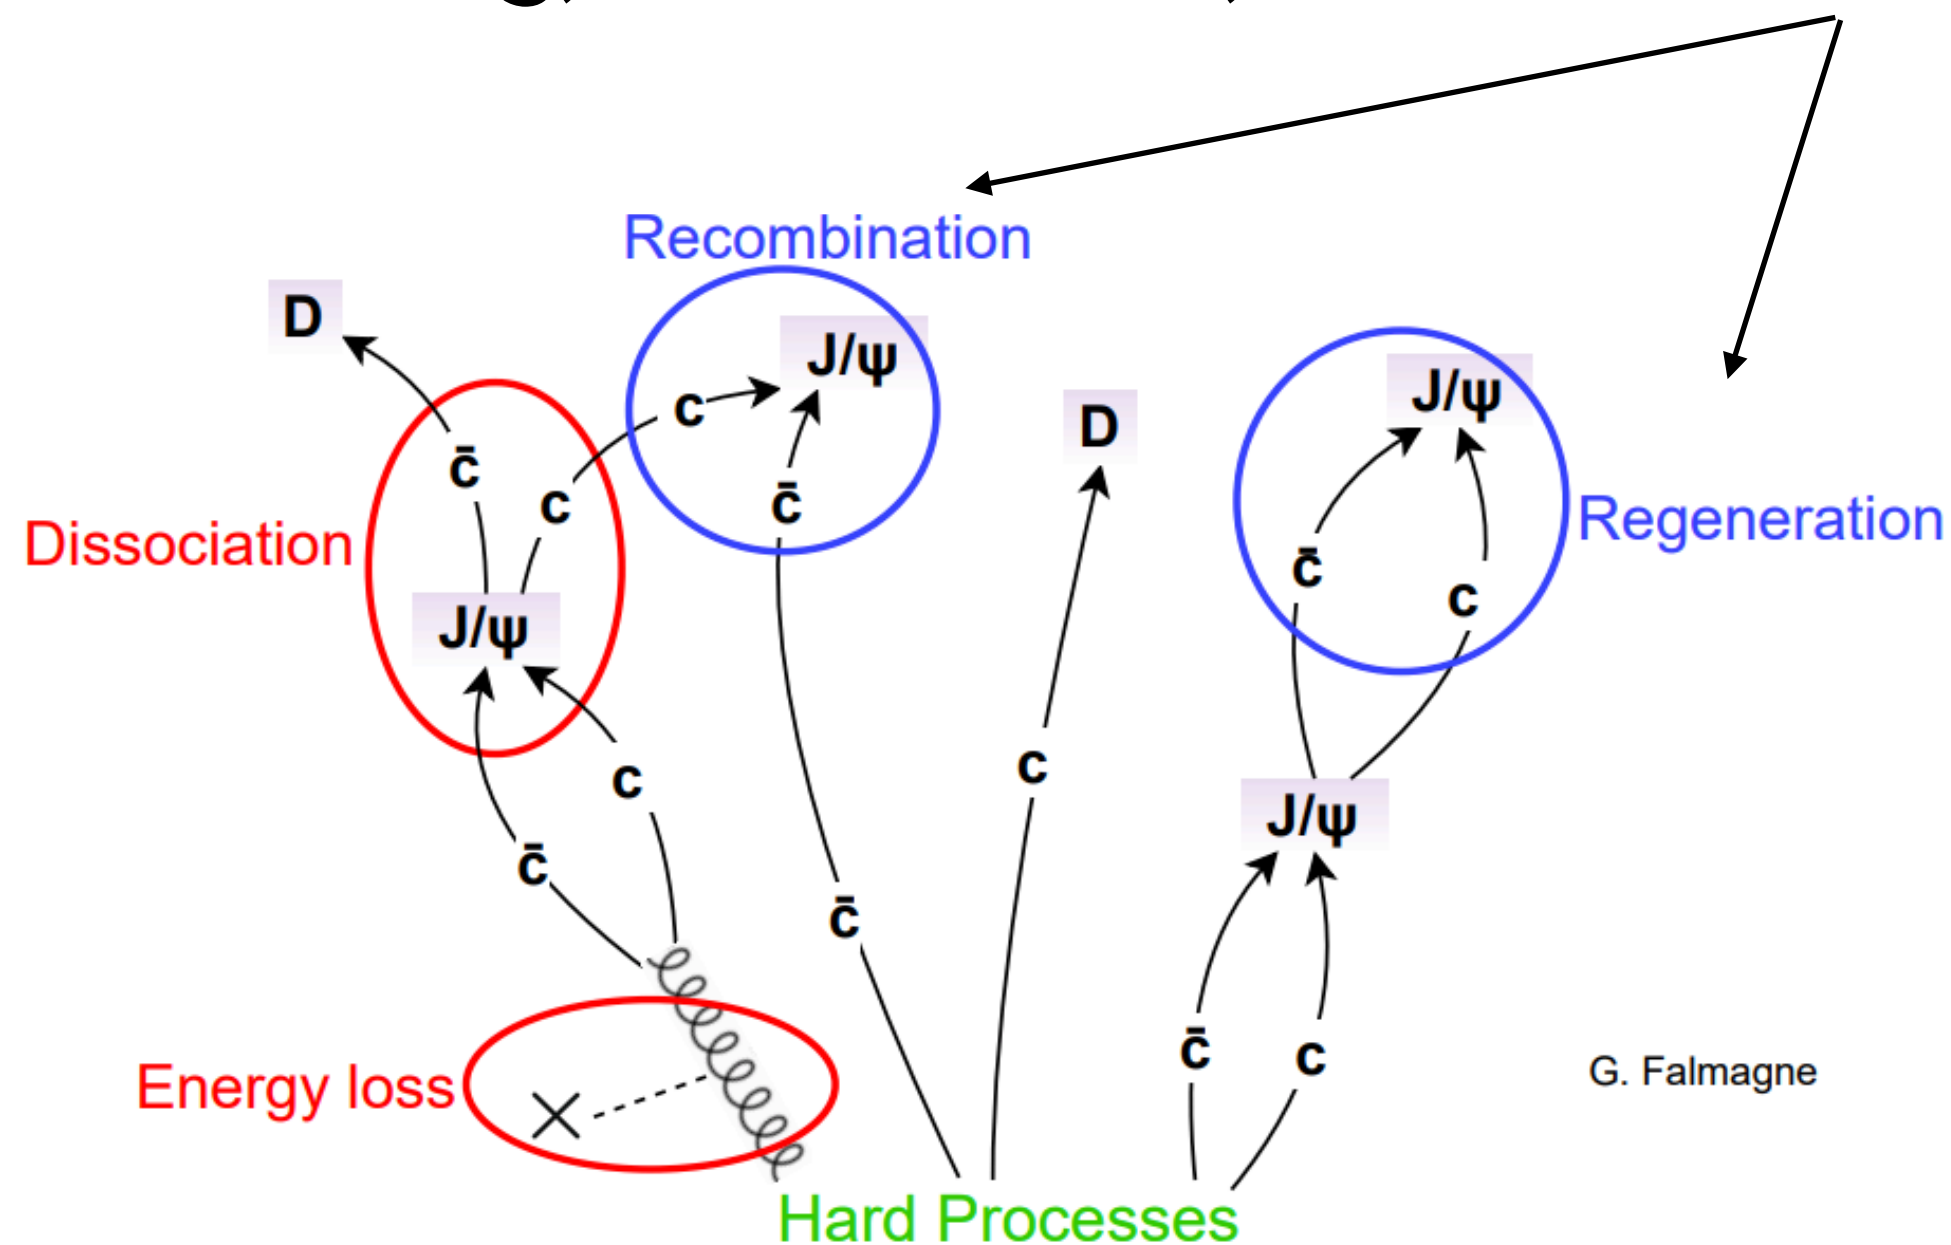

**SooHwan Lee**  
**Korea University**

- Bottomonia are good probes to study the QGP

Produced mostly from initial hard scattering

Sensitive to in-medium effects

(color screening, dissociation, recombination)

EPJC 61 (2009) 705-710

# Update of sequential suppression data

- Limited statistics in previous measurements
  - No **Y(3S)** visible in 2015 ↓
  - A nice opportunity to search for **Y(3S)** with CMS 2018 PbPb data ( × 4.3 lumi.)

$$R_{AA}(p_T, y) = \frac{d^2 N_{Y,corr}^{AA} / dp_T dy}{\langle T_{AA} \rangle d^2 \sigma_Y^{PP} / dp_T dy}$$

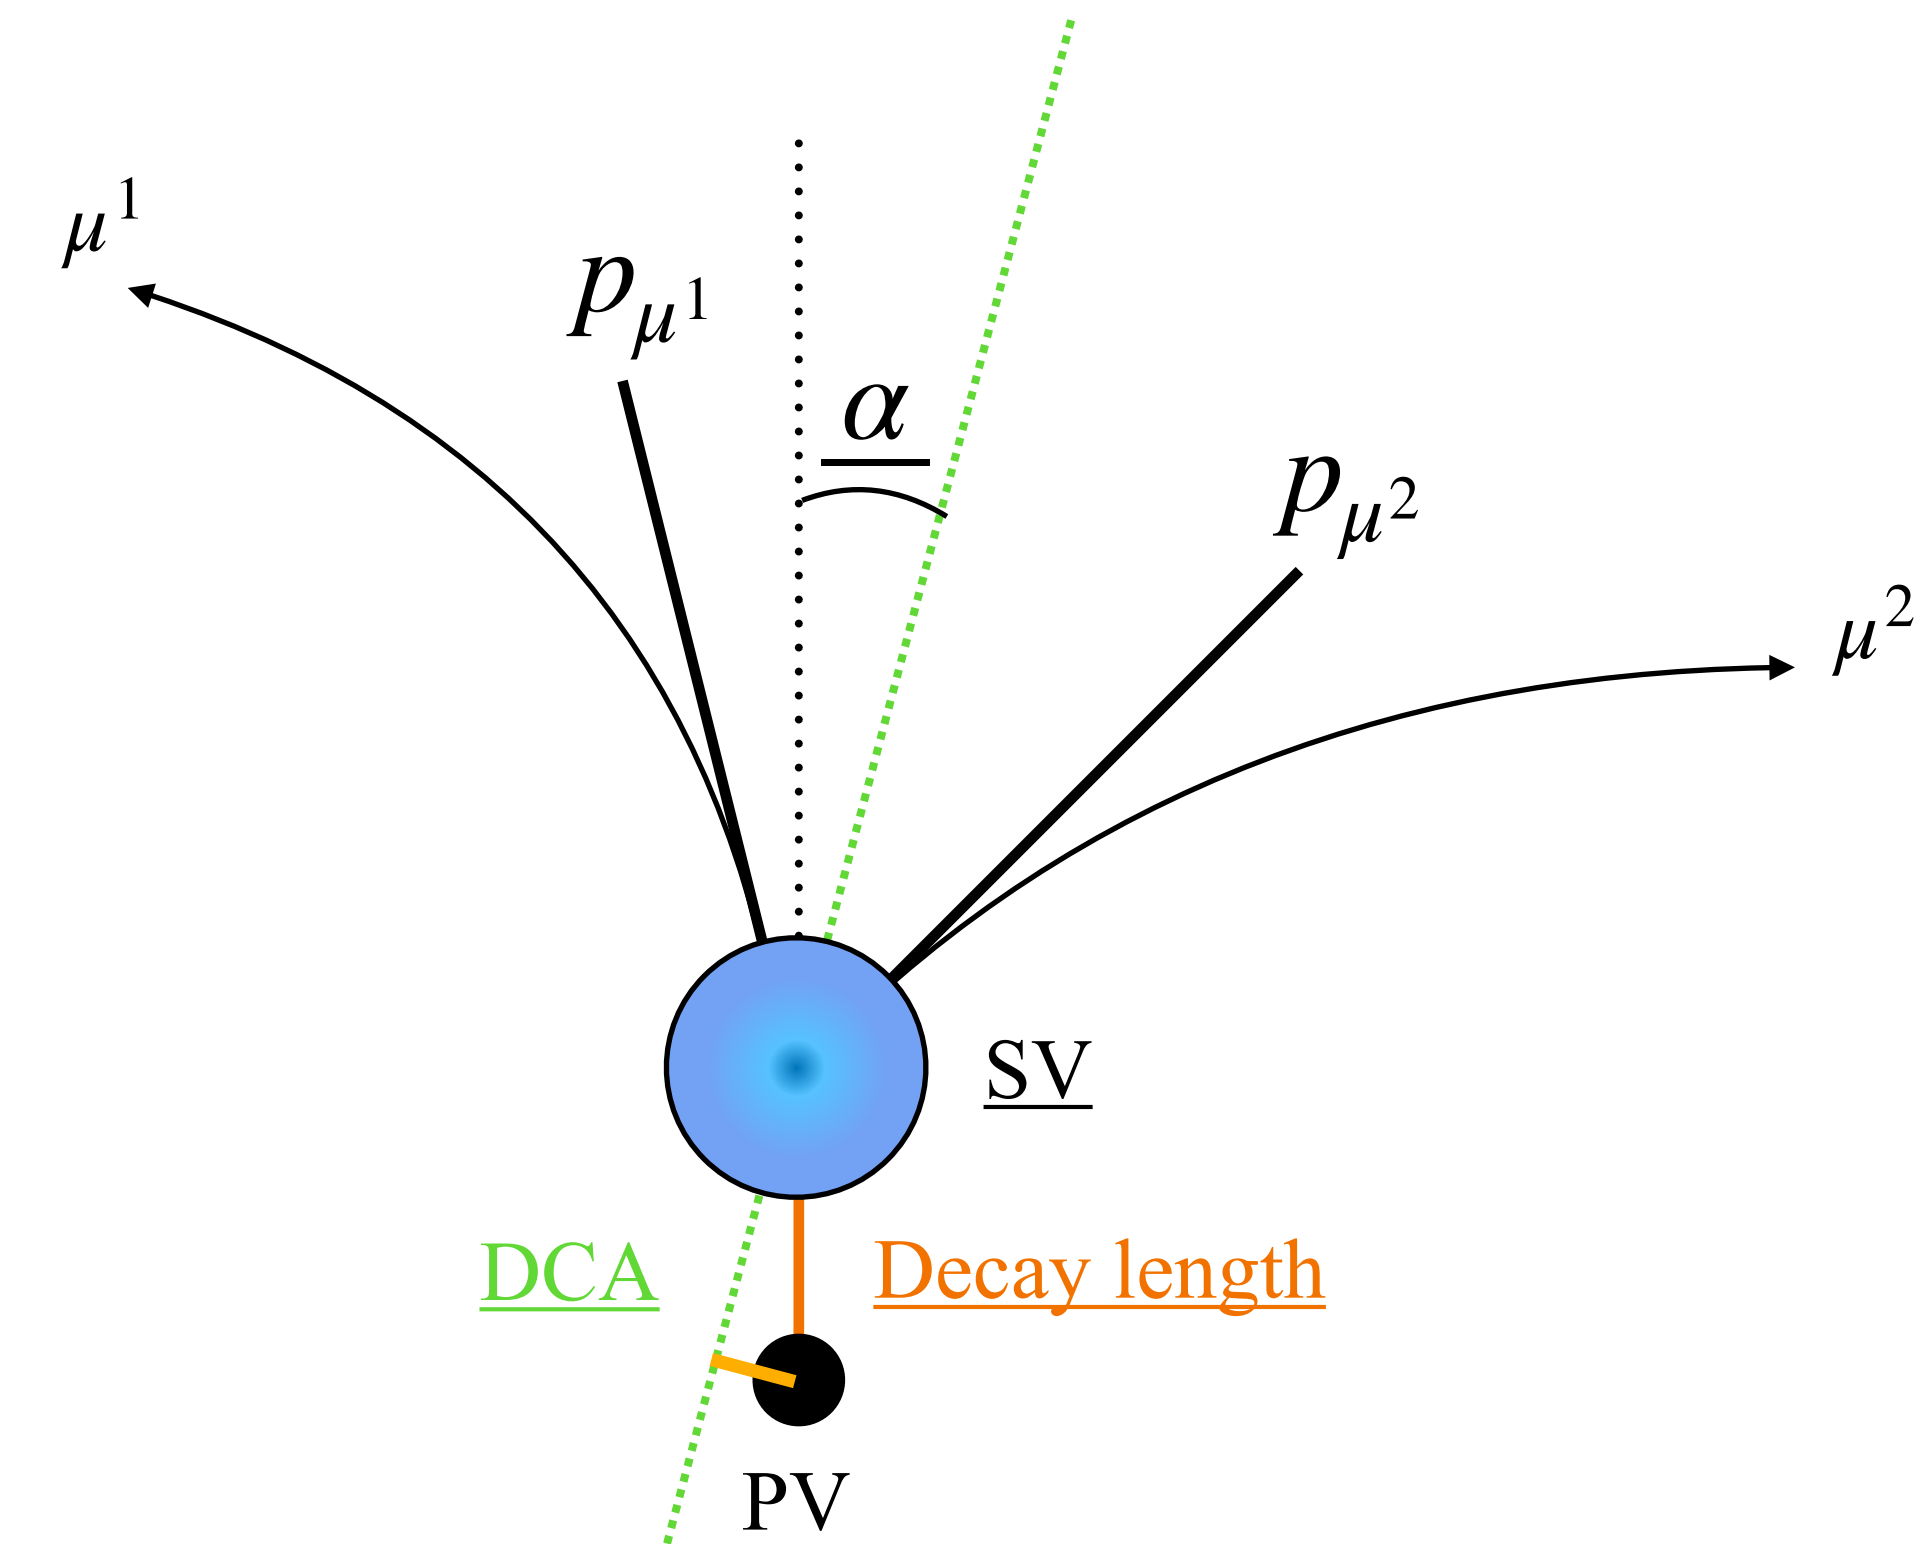

$\langle T_{AA} \rangle$ : average of nuclear overlap function

PLB 790 (2019) 270

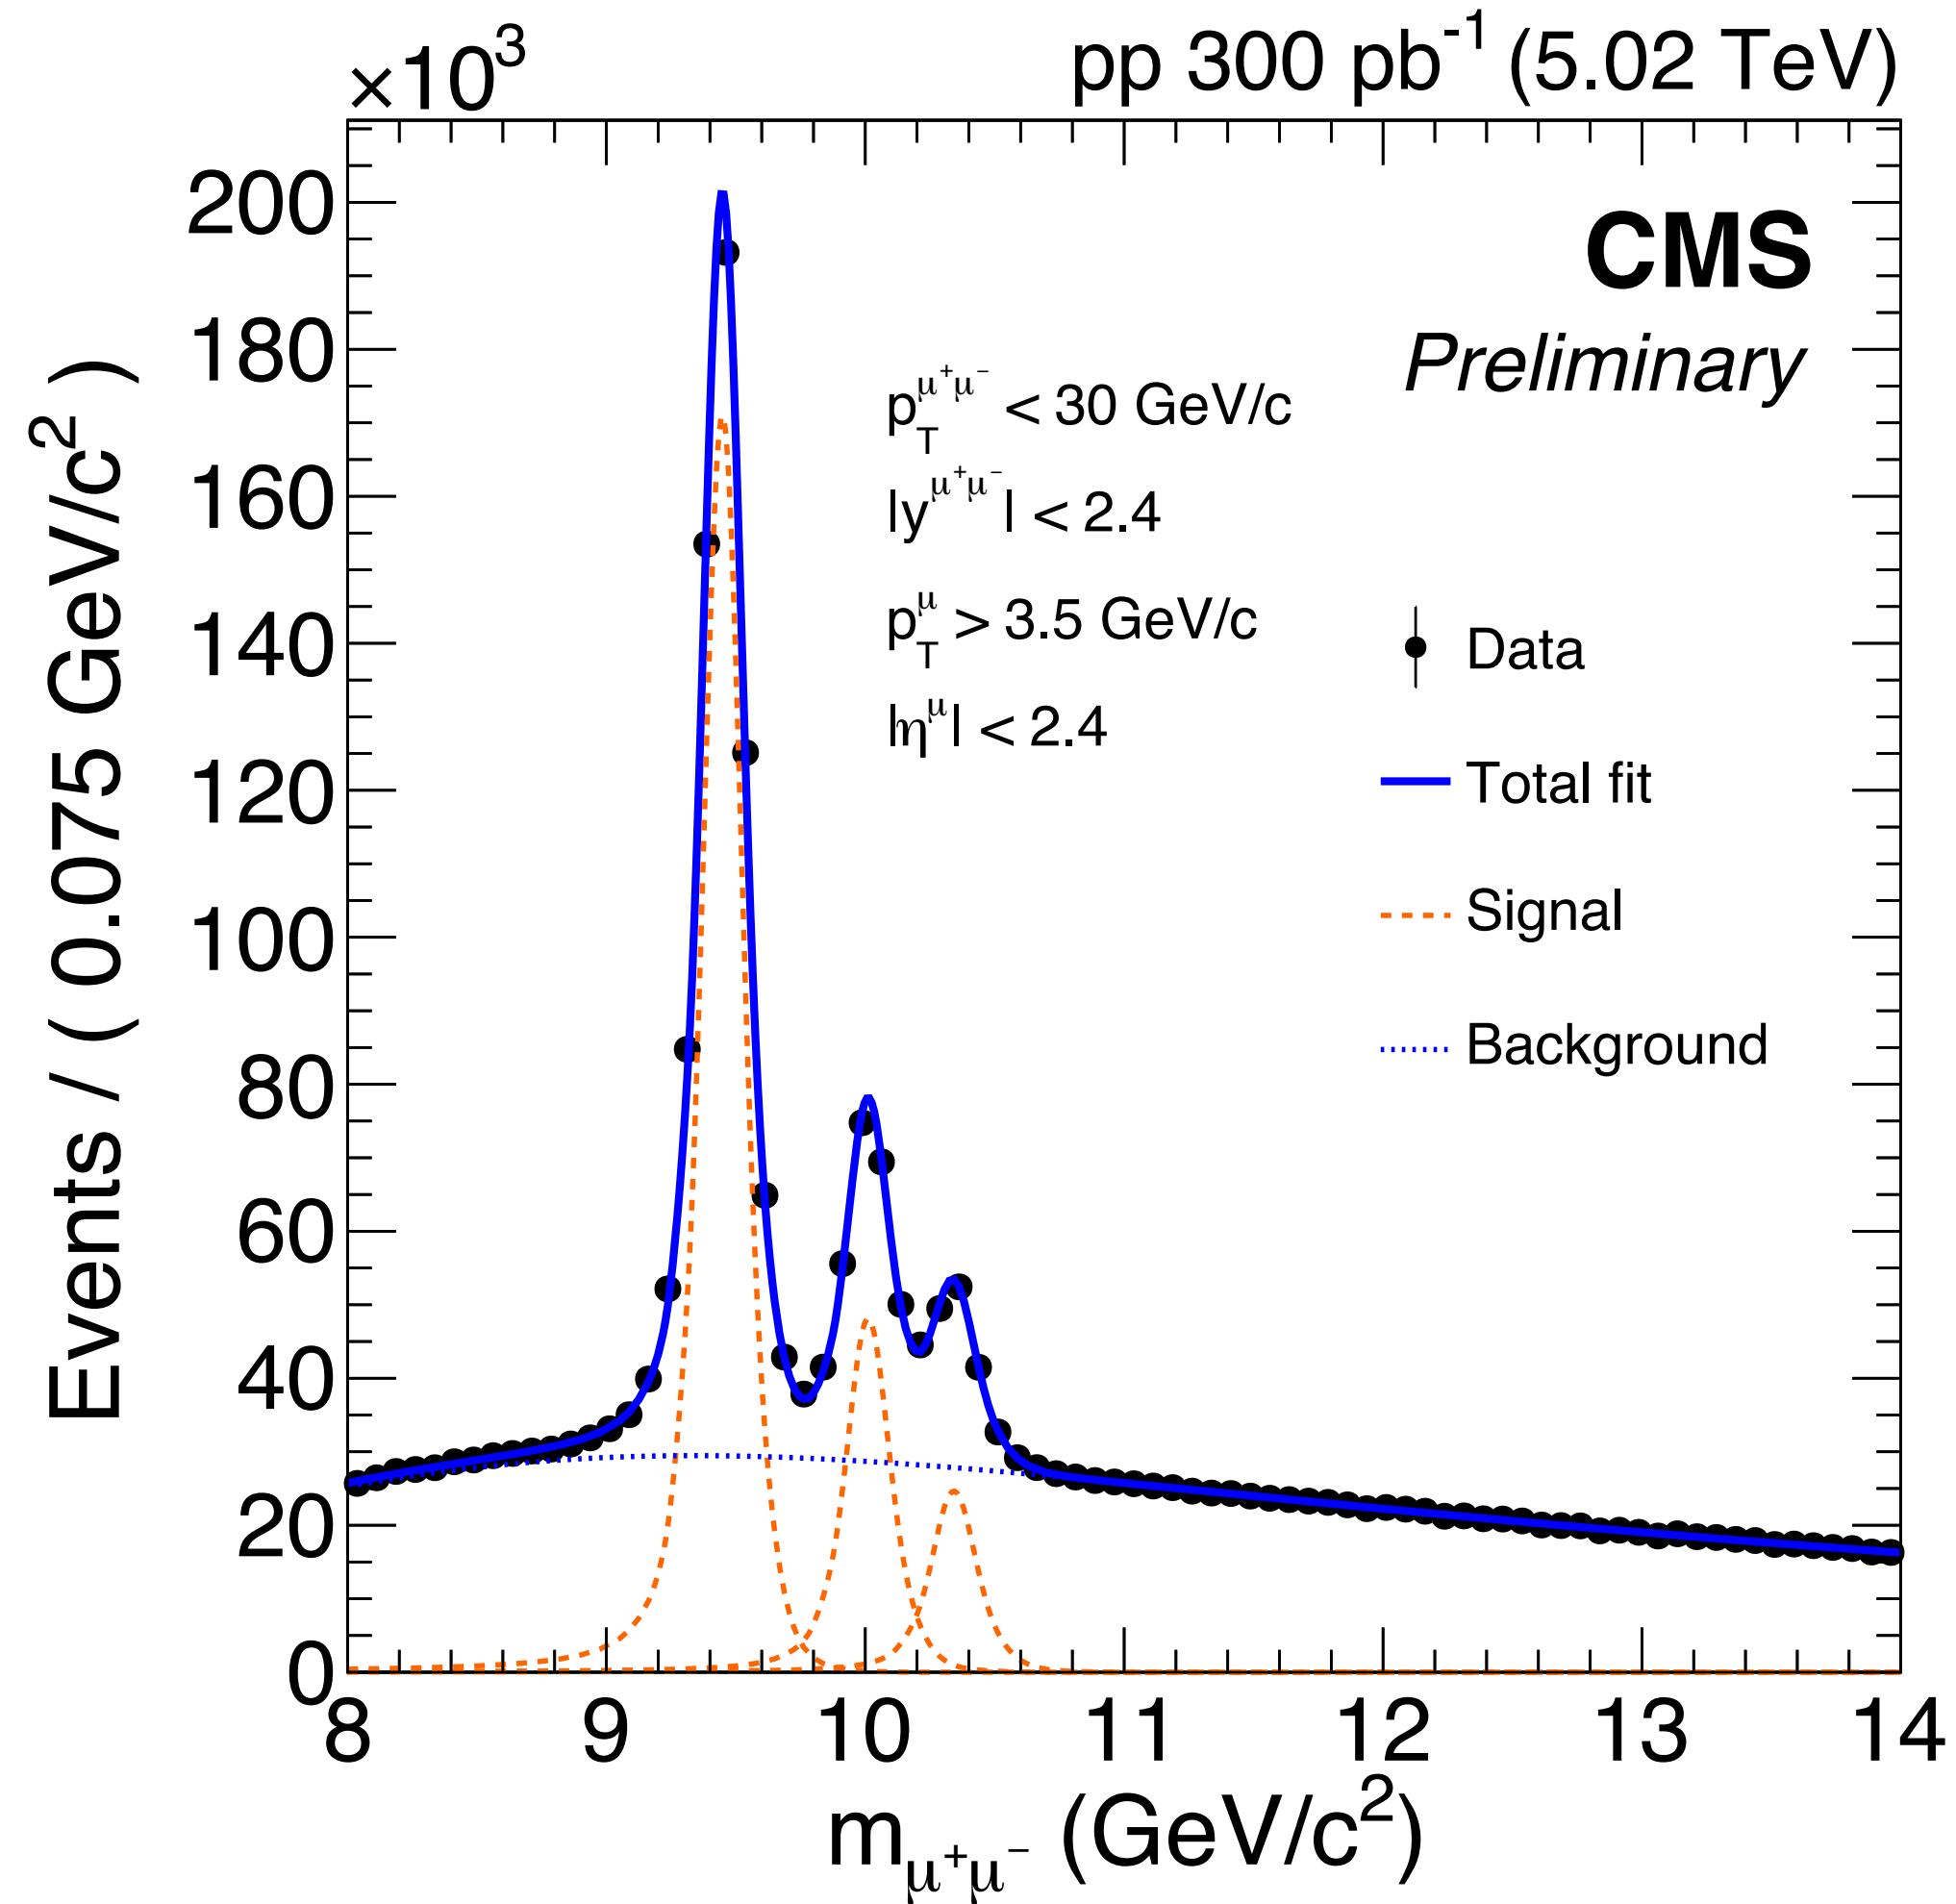

$m_{\mu^+\mu^-}$  (GeV)

- Signal(dimuon from  $Y(nS)$ ) enhancement with MVA selection(BDT) for PbPb data
  - Signal(MC) and background (side band data) classification
    - Pointing angle  $\alpha$
    - Distance to closest approach (DCA)
    - Vertex related information

# Y(nS) signal extraction

CMS-PAS-HIN-21-007

- Yield extracted with fitting on the BDT selected di-muon distribution with 3 Crystal Ball functions + background function.

🎯 First observation of **Y(3S)** in AA collision ( $> 5\sigma$ )!

$$R_{AA}(p_T, y) = \frac{d^2 N_{Y,corr}^{AA} / dp_T dy}{\langle T_{AA} \rangle d^2 \sigma_Y^{PP} / dp_T dy}$$

❖ **Y(3S)** measured in all centrality regions

❖ Improved **Y(2S)** measurement!

❖ Clear sequential suppression

$$R_{AA}(1S) > R_{AA}(2S) > R_{AA}(3S)$$

PbPb 1.6 nb<sup>-1</sup>, pp 300 pb<sup>-1</sup> (5.02 TeV)

**CMS**  
*Preliminary*

$|y| < 2.4$   
Cent. 0-90 %

- ❖  $Y(3S)$  measured in all  $p_T$  intervals
- ❖ Sequential suppression in measured  $p_T$  range
- ❖ Slight increase of  $R_{AA}(Y(3S))$  vs.  $p_T$
- ❖  $R_{AA}$  is lower for  $Y(3S)$  than  $Y(2S)$  in all intervals

# Suppression in pPb?

- ▶ Suppression also seen in backward rapidity (Pb going side)
- ▶ Explainable with comover interaction in low  $p_T$ ?

# Double ratio of $Y(3S) / Y(2S)$

❖ Stronger suppression of  $Y(3S)$  in more central region

❖  $Y(3S)$  more suppressed than  $Y(2S)$  in all  $p_T$  ranges

❖ No clear  $p_T$  dependance of double ratio  $Y(3S) / Y(2S)$

# $R_{AA}$ Comparison with theory : $N_{part}$

## ① Open quantum system + pNRQCD

PRD 104 094049

## ② Coupled Boltzmann Equation

JHEP 10(2018) 094

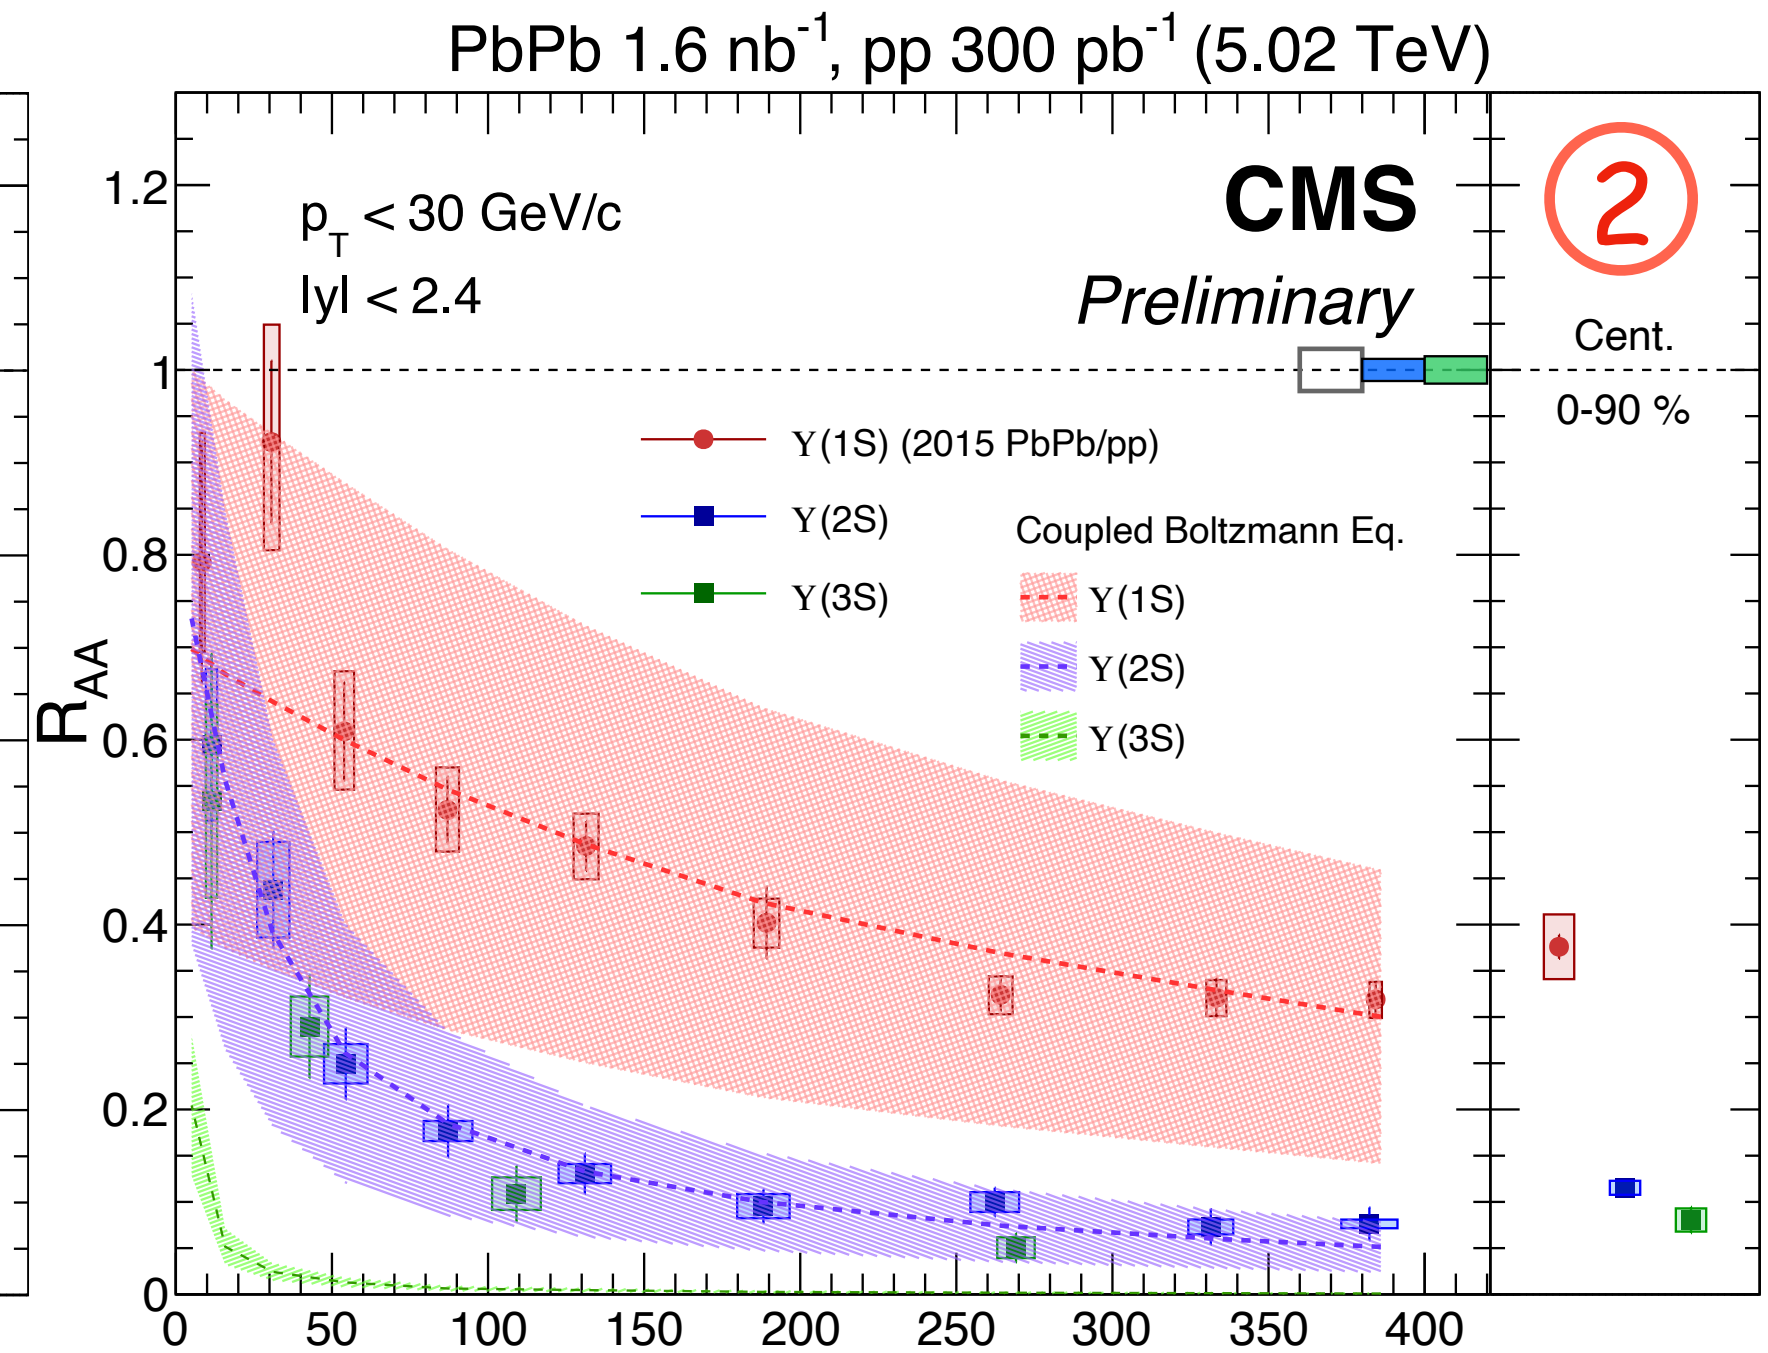

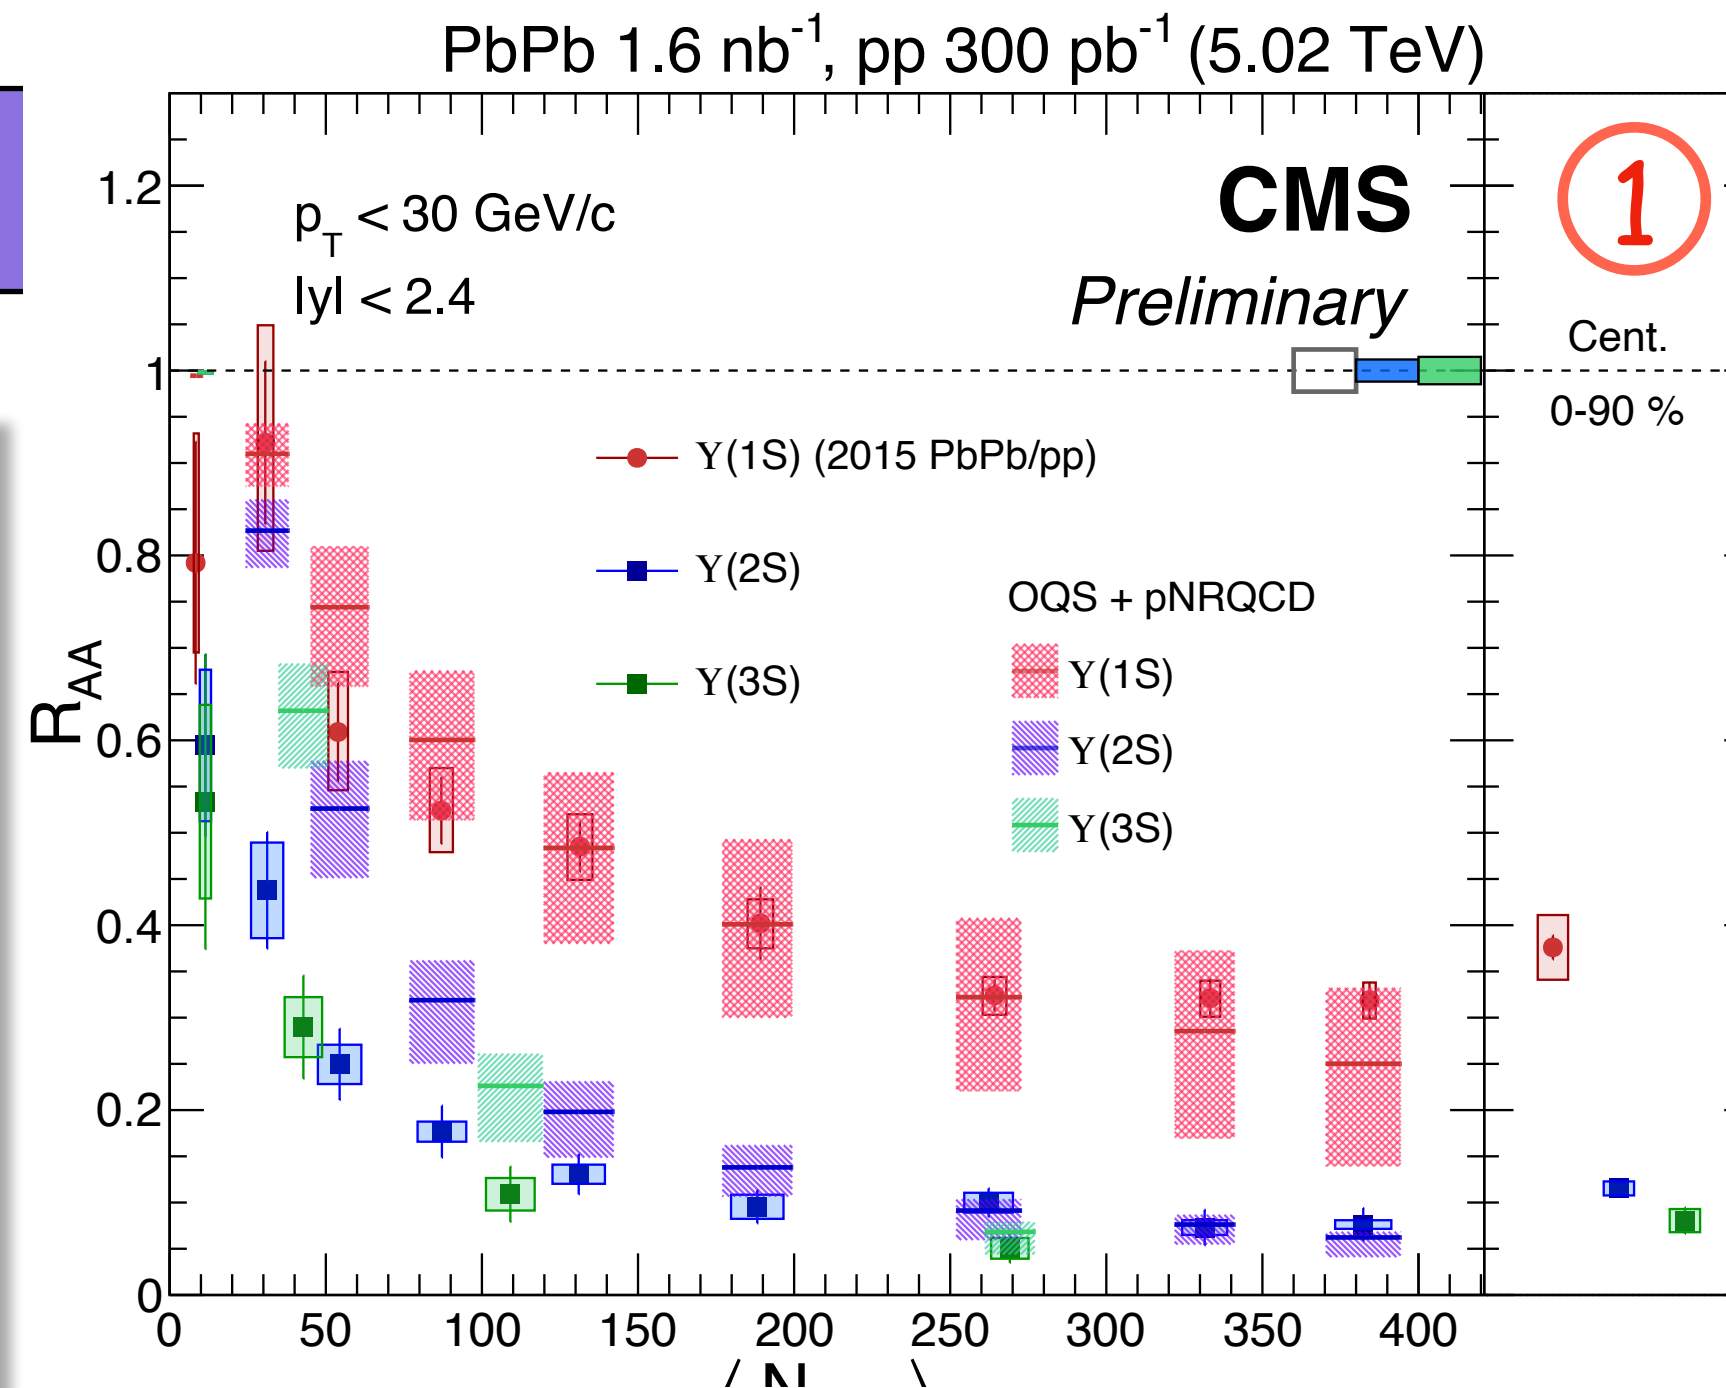

## ③ Transport rate equation

PRC 96 054901

## ④ Comover interaction model

JHEP 01(2021) 046

- Feed down contributions considered for all models
- Regeneration effect is different across the models( no reg. effect in (i) Y(3S) in (2) and (ii) all Y state in (4))
- Theory uncertainty such as nPDF parameters, CIM, dissociation temp., and transport coefficient

# $R_{AA}$ Comparison with theory (1)

PbPb 1.6 nb<sup>-1</sup>, pp 300 pb<sup>-1</sup> (5.02 TeV)

PRD 104 094049

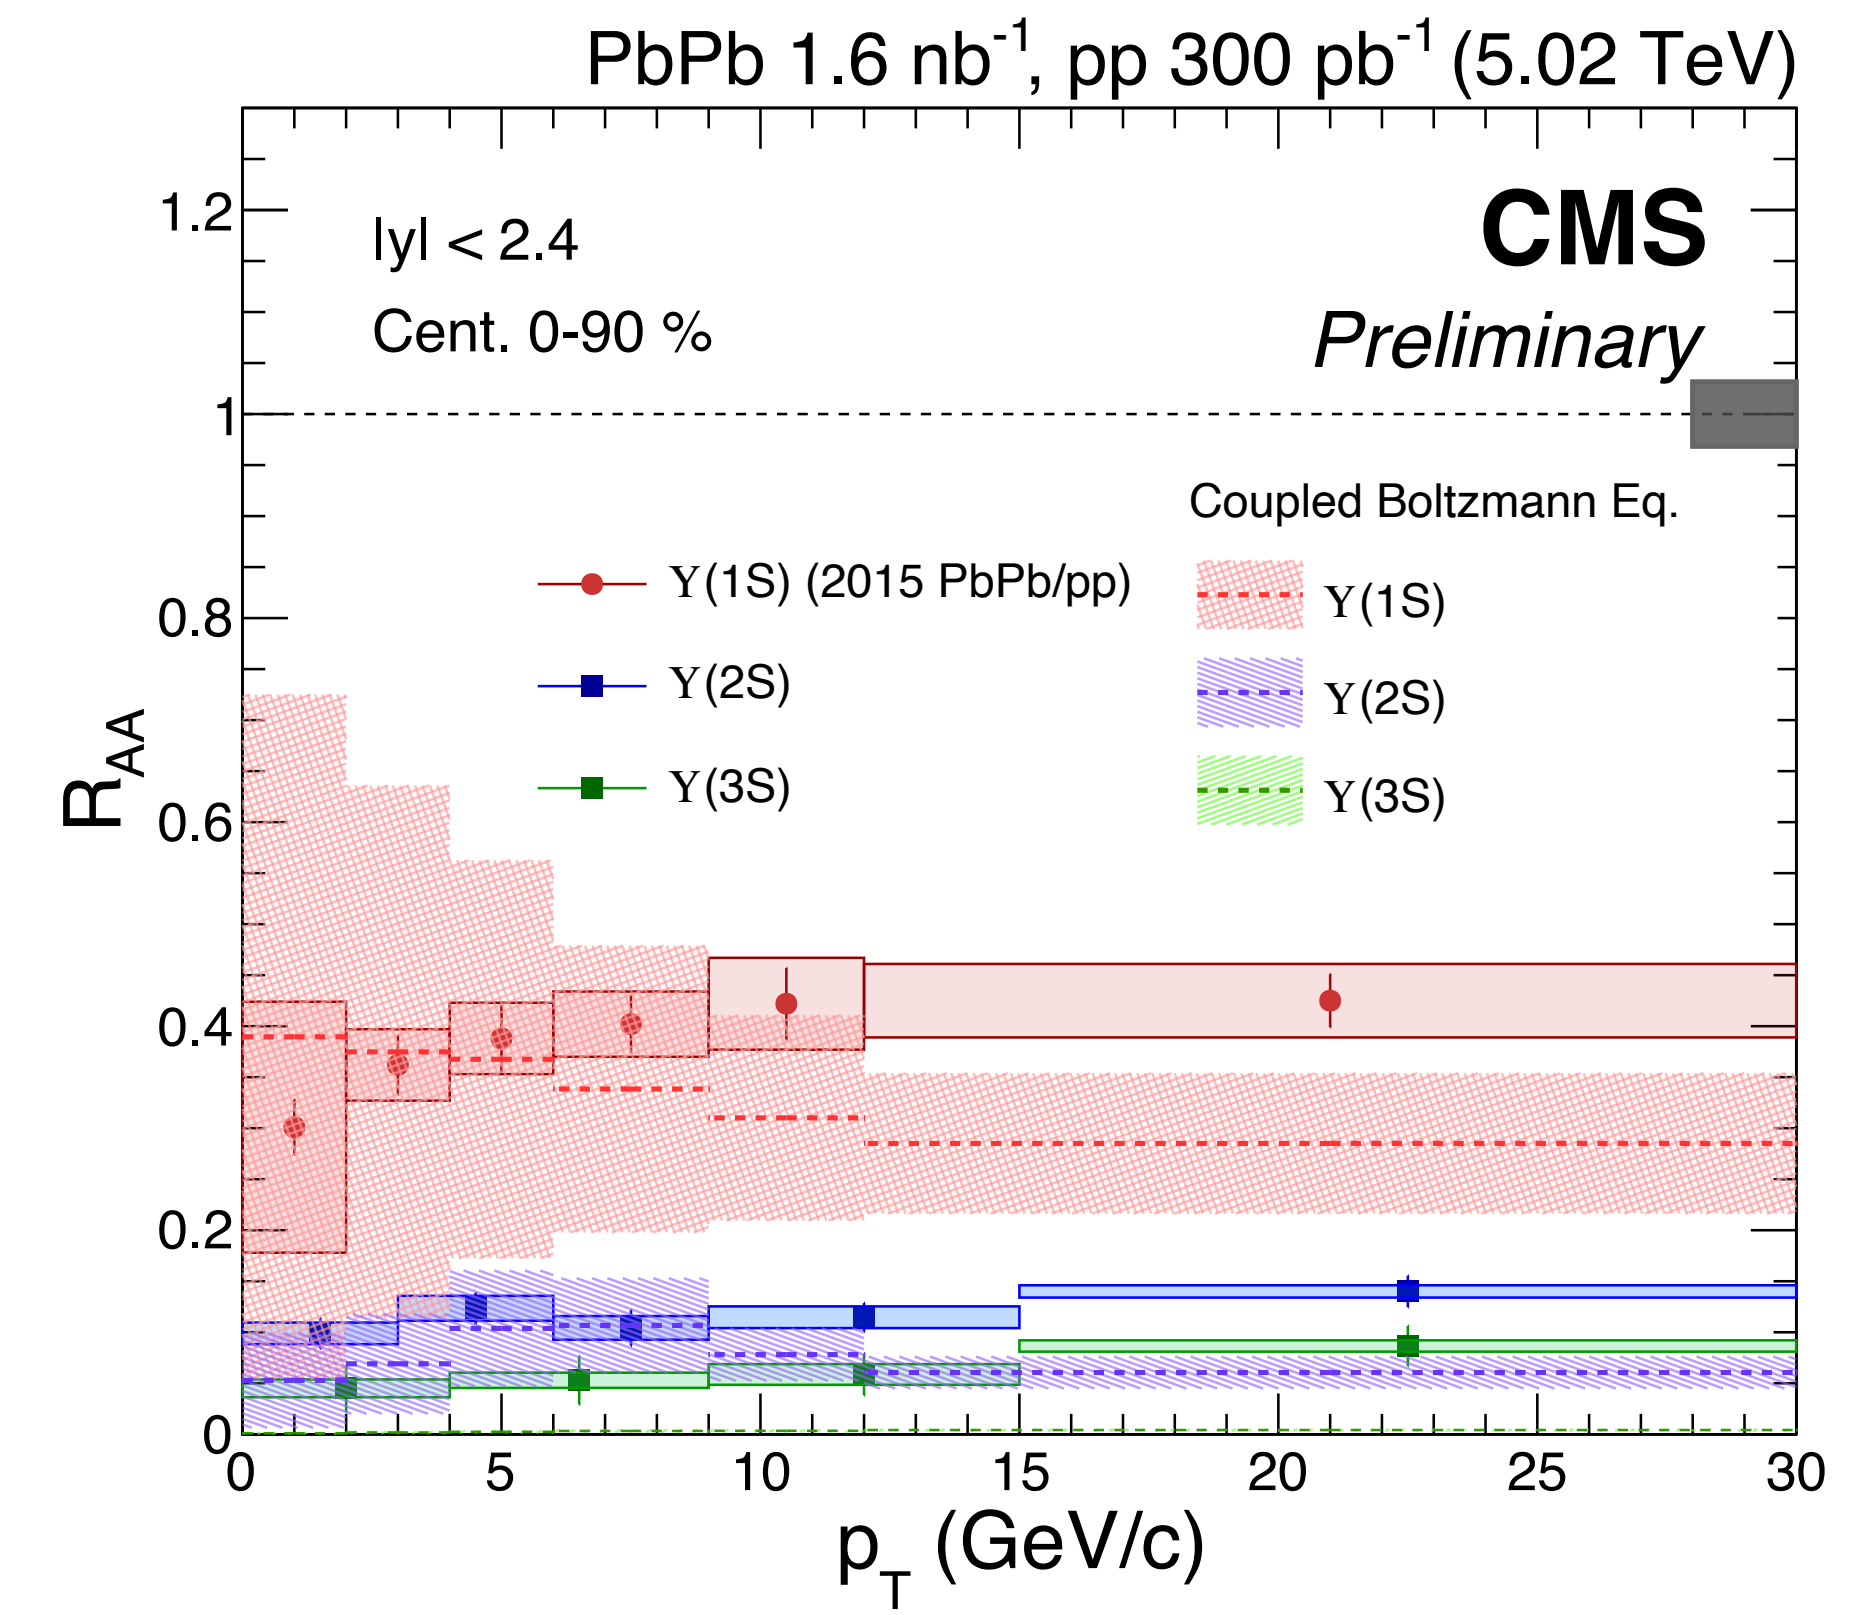

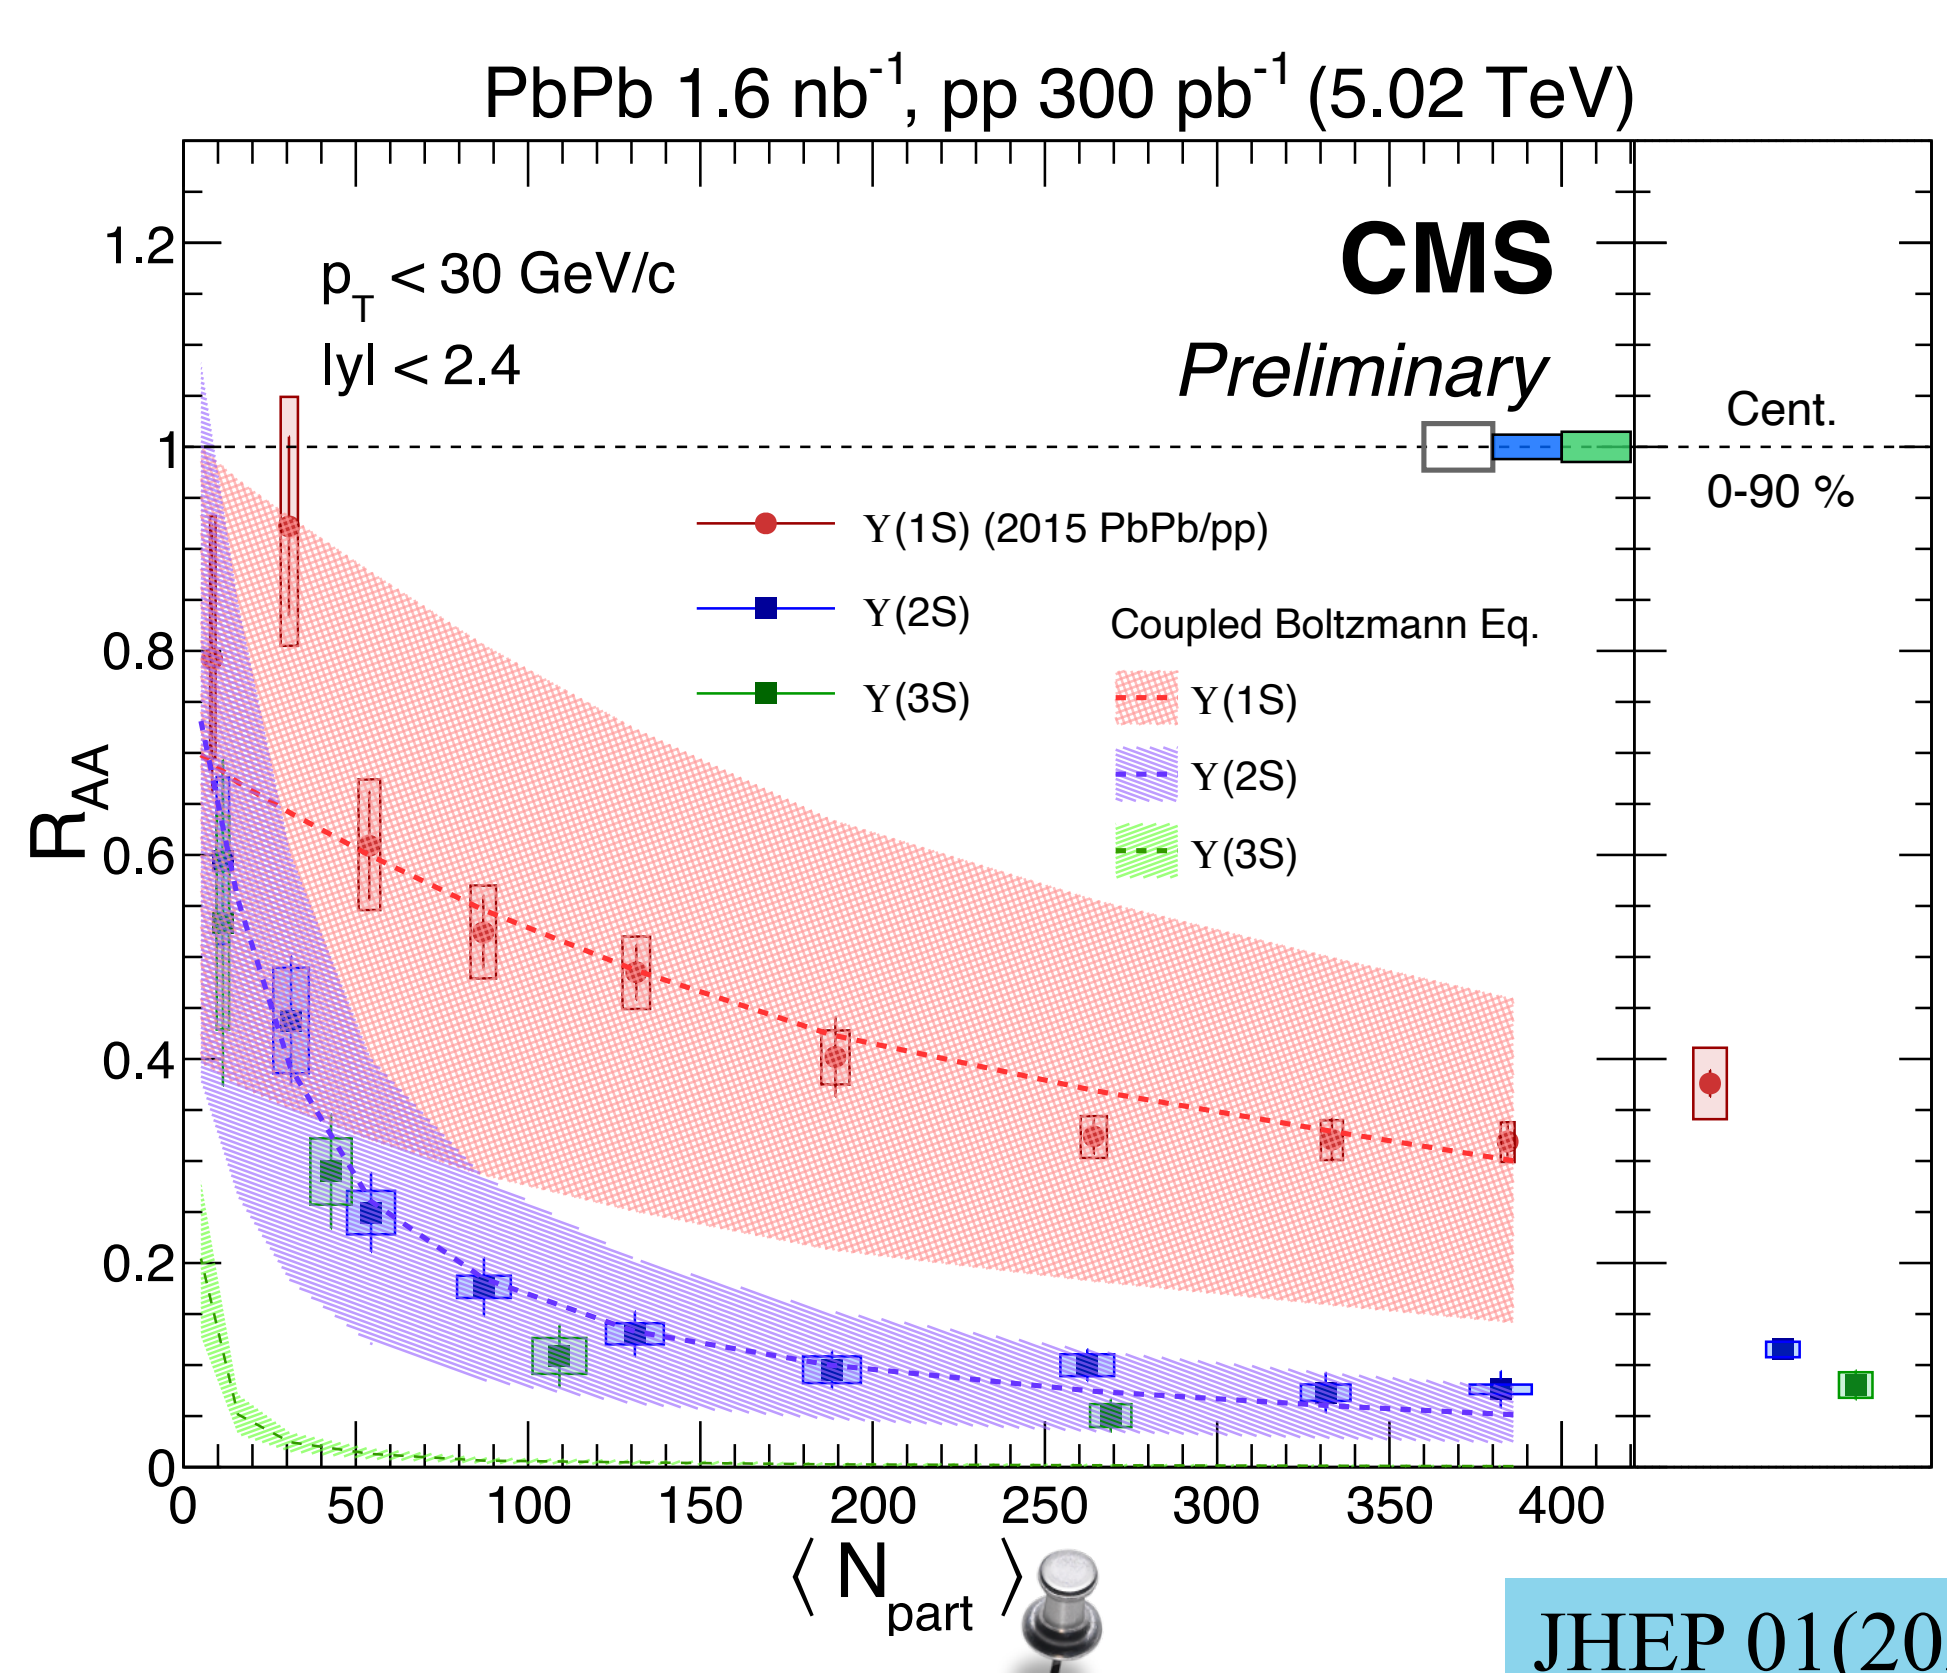

PbPb 1.6 nb<sup>-1</sup>, pp 300 pb<sup>-1</sup> (5.02 TeV)

- ❖ Discrepancy of excited states in mid-peripheral collisions
- ❖ Overestimates  $R_{AA}$   $Y(3S)$  vs  $p_T$

- Open quantum system + potential NRQCD**
- Dissociation & regeneration
- No CNM effects
- Similar  $R_{AA}$  for the excited states
- Feed down contributions included

# $R_{AA}$ Comparison with theory (2)

JHEP 01(2021) 046

**Coupled Boltzmann Equation**

- Dissociation & regeneration
- Large uncertainty from nPDF EPPS16
- No regeneration included for **Y(3S)**
- Feed down contributions considered

- ❖ Predicts larger **Y(3S)** suppression than data
- ❖ Discrepancy at high  $p_T$

# $R_{AA}$ Comparison with theory (3)

PbPb 1.6 nb<sup>-1</sup>, pp 300 pb<sup>-1</sup> (5.02 TeV)

PRC 96 054901

PbPb 1.6 nb<sup>-1</sup>, pp 300 pb<sup>-1</sup> (5.02 TeV)

## Kinetic rate equation

- In medium binding energy with T-matrix calculation
- Regeneration of excited states
- Feed down contributions considered

- ❖  $R_{AA}$  description of the two excited states quite well in most kinematic ranges
  - ❖ Difference is seen in the most central collision & **Y(1S)** high  $p_T$
  - ❖ Regeneration dominant in excited states

# $R_{AA}$ Comparison with theory (4)

## Comover interaction model + nCTEQ15

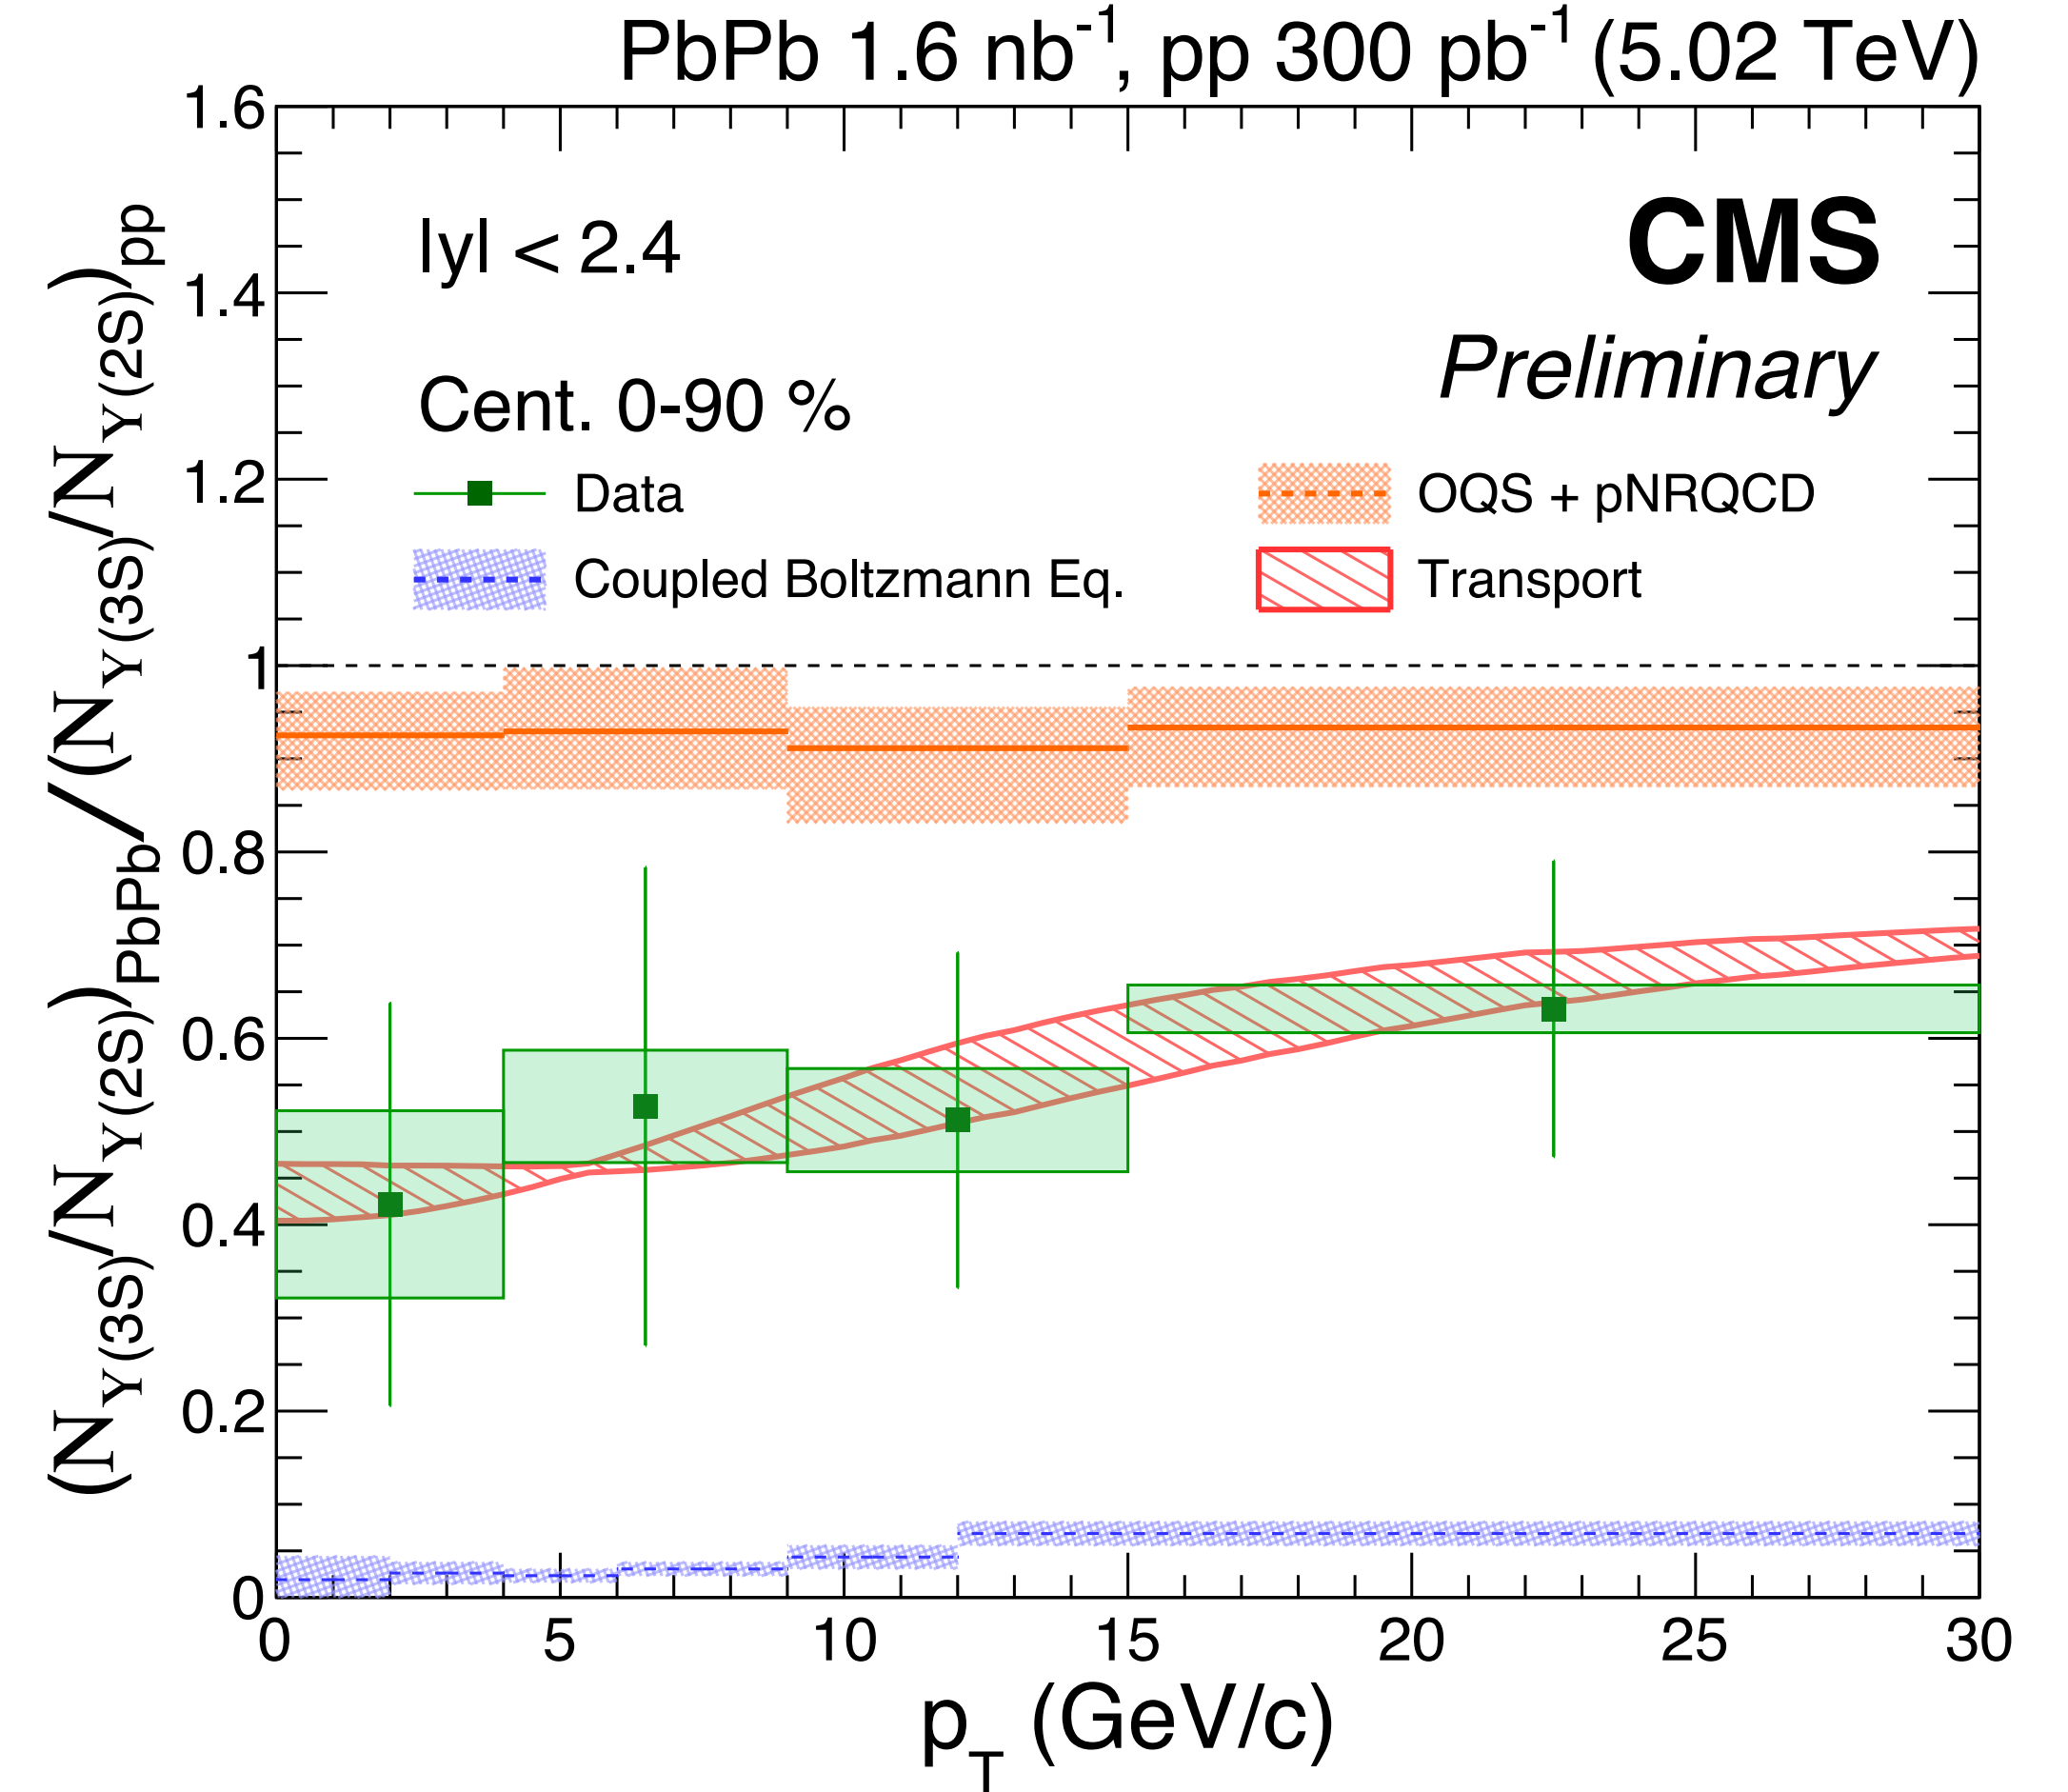

JHEP 10(2018) 094

- Gluon acting as proxy of pion in comover breakup
- No regeneration calculation
- nPDF + CIM cross-section uncertainties combined
- Feed down contributions included

❖ Lower  $R_{AA}$  for **Y(3S)** than data towards central collisions

📌 Some mismatches between data and theories

# Double ratio comparison with theories

**Models expect different rate of suppression between the excited states!**

# Conclusion & Take home Message

First observation of **Y(3S)** in PbPb collisions!

Sequential suppression of **Y(nS)**

Strong constraints on theoretical models

Need to carefully treat the theoretical ingredients

New data from Run3 around the corner!
